                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            원
```

```
The invention relates to a novel isolated nucleic acid molecule comprising: a sequence encoding a sequence comprising 11-1518 amino acids; a sequence comprising 190-8144 bp; or a sequence that selectively hybridises to, or having at least 60% identity with the 11-1518 amino
                                                                                                         120
                                                                                                                                                              140
                                                                                                                                                                                                                  160
                                                                                                                                                                                                                                          582
                                                                                                                                                                                                                                                                        180
                                                                                                                                    462
                                                                                                                                                                                        522
                                                                                                                                                                                                                                                                                                642

The present invention describes human nucleic acid-associated proteins designated NAAP-1 to NAAP-57. The human NAAPs have cytostatic, antiarteriosclerotic, antiarthy, antiallergic, cerebroprotective, antiarteriosclerotic, anticonvulsant, noctropic, neuroprotective, cantinflammatory, ophthalmological, thyromimetic, antiarthritic, hepatotropic, antibacterial, virucide, protozoacide, antiparasitic and fungicide activities, and can be used in gene therapy. The NAAP protein can polynucleotide sequences can be used in diagnosing, treating and preventing diseases or conditions associated with the decreased corpression or overexpression of NAAP, such as cell proliferative diseases (e.g. cancer, atherosclerosis, hepatitis), neurological disorders (Parkinson's disease, Alzheimer's disease, stroke, epilepsy), developmental disorders (renal tubular acidosis, ansemia, glaucoma, CC hypothyroidism), autoimmanofinflammatory disorders (AIDS, allergies, atopic dermatitis, arthritis) and infections (e.g. bacterial, viral, parasitic, protozoal, fungal). The present sequence encodes human NAAP-
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               New human nucleic acid-associated proteins (NAAP), useful for diagnosing, treating and preventing diseases or conditions associated with the aberrant NAAP expression, e.g. cancer, hepatitis, AIDS, atherosclerosis,

The invention discloses a polymuclectide comprising a sequence selected from 1970 fully defined nucleotide sequences which encode novel

C from 1970 fully defined nucleotide sequences which encode novel

CC polypeptides. Also claimed is a polypeptide encoded by the polymuclectide, immunologically assaying the polypeptide or peptide of the polymuclectide by contacting the polypeptide or peptide of the polymuclectide by contacting the polypeptide or peptide of the polymuclectide by contacting the polypucle or peptide or peptide of the manipody of the encoded protein, and observing the binding between the two, a transformant carrying the polymuclectide in an expressible manner and an antisense polymuclectide. The oligomuclectide is useful as a primer for synthesising the polymuclectide on as a probe contacting the polymuclectides and encoded proteins are useful as pharmaceutical agents and many disease-related contacting the polymuclectides and encoded genes may be included in them, for developing a diagnostic marker or medicines for regulation of their expression and activity, or as targets of gene therapy. The genes are involved in tissue and/or cell regeneration. Membrane proteins, signal transduction-related proteins, of generation of their expression and activity, or expression of the encoded proteins and genes cancer, tumours. The cDNA may be used to regulate the activity or expression of the encoded protein to read assasses. The cancel gate for this patent is not represented in the printed specification, but is based on sequence information supplied by the European Patent Office.

The invention describes an isolated human nucleic acid (I) encoding any of 120 10-1533 residue amino acid sequences (S1), given in the specification, comprising any of 164 179-12421 base pair sequences (S2), given in the specification. The methods and compositions of the present invention are useful for identifying, diagnosing, monitoring, staging, imaging and treating lung cancer and non-cancerous diseases of the lung. They are also used for identifying lung tissue, monitoring and identifying and/or designing antagonists of the polypeptide of the invention, gene therapy, production of transgenic animals and production of engineered lung tissue for treatment and research. This sequence
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     New isolated human nucleic acid molecule and polypeptide, useful for identifying, diagnosing, monitoring, staging, imaging and treating lung cancer and non-cancerous diseases of the lung.
                                                                                                                                                                                                                                                                                                        Human; gene therapy; vaccine; lung specific antigen; cancer diagnosis; cancer monitoring; cancer staging; cancer imaging; lung cancer; non-cancerous diseases of the lung; transgenic animal; gene; ss.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            596
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            erGlnProTrpAlaAlaAlaSerAlaThrProMetLeuSerSerLysAlaSerLeuCysI 138
                                                                                                                                                                                                              The invention describes an isolated human nucleic acid (I) encoding any of 120 10-1533 residue amino acid sequences (S1), given in the specification, comprising any of 164 179-12421 base pair sequences (S2), given in the specification. The methods and compositions of the present invention are useful for identifying, diagnosting, monitoring, staging, imaging and treating lung cancer and non-cancerous diseases of the lung. They are also used for identifying lung tissue, monitoring and identifying and/or designing antagonists of the polypeptide of the invention, gene therapy, production of transgenic animals and production of engineered lung tissue for treatment and research. The present sequence is one of 3351 sequences in a library of human polymucleotides. The library is used to detect differentially expressed genes correlated with a cancerous state of a mammalian cell and can detect colon, prostate, breast and lung cancer. The library can be used to produce probes for detection of mRNA and to produce additional copies to produce probes for detection of transcription levels. Ribozymes or antisense oligonucleotides and be generated. The polymucleotides and for detection of transcription levels. Ribozymes or antisense oligonucleotides can be generated. The polymucleotides and their gene products are used as genetic or biochemical markers (e.g. in blood or tissues) that will detect the earliest changes along the carcinogenesis pathway and/or monitor the efficacy of therapies and preventive interventions. The polymucleotides, polypeptides and preventive interventions. The polymucleotides, polypeptides and transcriptions to treat the cancers and proliferative disorders such as neoplasia, cypylasia and hyperplasia
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        242

The invention relates to a substantially purified nucleic acid molecule encoding a nitrite reductase of SEQ ID NO. 11926. Further disclosed is a recombinant DNA construct for expression of a nitrite reductase gene in a plant cell comprising the recombinant DNA construct. The nucleic acid is useful for determining gene expression, identifying mutations in a gene of interest, and for constructing mutations in a gene of interest in records for SEQ IDs 1-1849 represent a set of 1849 contig and singleton sequences comprising coding sequences, but regination elements, promoters and other regulatory elements from the genome of the bacterium Maycoccous xanthus. Note: The sequence data for this patent did not form part of the printed specification, but was

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     1369 AGGTGGCCAGCCGGAGCTCCT---TGCTCGTCAGGTGCTGCCTTCCTTCAGCGAGTACA 1313
                                                                                                                                                                                                                                                                                                                                 The invention relates to a substantially purified nucleic acid molecule encoding a nitrite reductase of SEQ ID NO. 11926. Further disclosed is a recombinant DNA construct for expression of a nitrite reductase gene in a plant cell, and a plant cell comprising the recombinant DNA construct. The nucleic acid is useful for determining gene expression, identifying mutations in a gene of interest, and for constructing mutations in a gene of interest, and for constructing mutations in a gene of interest sequence given in records for SEQ IDS 1850-9591 represent a set of about 7842 genes or partial genes from the genome of the bacterium Mxyococcus xanthus. Note: The sequence data for this patent did not form part of the printed specification, but was obtained in electronic format
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   AlaThrProMetLeuSerSerLysAlaSerLeuCysIleProThr------- 140

The present invention describes DNAs encoding hair keratin-associated proteins (KAP) of human origin, which bind to hair keratin. Also described: (1) DNA encoding KAPs of mouse origin; (2) proteins encoded by the human and mouse DNA, and their partial peptides, and proteins derived from them by addition, deletion and/or substitution of one or more amino acid residues; (3) DNA hybridising to the DNA encoding KAP; (4) peptides (5) excressory (1), where X = Q, V, R or I, and YGGKGYGGY (II), where X = Y, C i. or F; (5) fusion proteins and peptides; (a) recombinant proteins and peptides; (b) expression vectors containing the DNA encoding KAP; (c) peptides together with a marker protein or peptide; (6) antibodies to the peptides; (8) expression vectors containing the DNA encoding KAP; (9) host cells transformed by these vectors; (10) non-human animals which care knockout animals for KAP or which overexpress KAP; (11) screening substances promoting or inhibiting the binding of KAP; compounds substances promoting or inhibiting the expression of KAP, comprising using KAP or promoting or inhibiting the expression of KAP; compounds compositions containing these compounds, or containing KAP or their partial peptides or (11), expression vectors for them; or host compositions containing these compounds, or containing KAP or their partial peptides or (11), expression vectors for them; or host compositions (such as hair and beard growth improvers, hair colourants or growth promoters. The KAPs are useful as active ingredients in toiletry compositions (such as hair and beard growth improvers, hair colourants and hair and beard growth improvers, hair colourants and animal KAP genes are located on chromosome 21, more specifically to 21q22.3. The present sequence is used in the

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           The sequence codes for an antigenic protein which binds with an antibody directed against an antigenic protein of avian coccidia, (esp. a protein of E.tenella sporozoite). It may be used for immunising birds against avian coccidiosis. The specification also includes a generic version of this sequence to cover all the degenerate codons coding for a protein having the amino acid sequence of AAP60577. (Updated on 25-MAR-2003 to correct PA field.)

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                It encodes two antigenic proteins (AP) which bind with a monoclonal antibody (MAb) or polyvalent Ab directed against an AP of avian coccidia. (8X5401 is claimed in claim 1, and GX2364 is claimed in claim 2. Also new are an expression vector contg. the cloned gene, host cells transformed with the vector, and AP encoded by the cloned gene. The transformed cells are used in a vaccine to immunise birds against avian coccidiosis. By labelling the peptides, they can be used as a type-specific probe. The AP may also be used in an assay to detect Ab against the coccidia. The Abs are used to identify transformed cells contg. the DNA. (Updated on 25-MAR - 2003 to correct PA field.)

CDNA encoding the GX5401 antigen to identify clones encoding extensions of the GX5401 coding sequence. Several plaques reactive with the CDNA were identified. DNA from clone number 533 was sequenced. This analysis showed that the coding sequence in this clone overlaps with the GX5401 coding sequence and extends that sequence toward the N-terminal coding region. Analysis of the new sequence together with the GX5401 antigen coding sequence reveals an open reading frame encoding an Eimeria protein coding sequence and extends that sequence together with the GX5401 antigen coding sequence reveals an open reading frame encoding an Eimeria protein coding sequence and is rich in cysteine residues. The open reading frame encodes a potential signal sequence for protein secretion. The coding sequence for this antigenic protein is given in AAN93324. Also new are an expression vector contg. the cloned gene, host cells transformed with the vector, and AP encoded by the cloned gene. The transformed cells are used in a vaccine to immunise birds against avian coccidiosis. By labelling the peptides, they can be used as a type-specific probe. The AP may also be used in an assay to detect Ab against the coccidia. The Abs are used to identify transformed cells contg. the DNA. (Updated on 25-MAR-2003 to correct PA field.)
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        6189
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   6068 GCTCCTCCAGCACCTGCTCTTCTCCGGGGAGCTCCTCAGCATTGCCGCCAGAG 6009

The present invention describes a nucleic acid (I) comprising a sequence encoding a 250 kDa polypeptide from Sporozoites/Merozoites of Eimeria maxima or its homologue or complement. Also described: (I) a vector comprising the nucleic acid; (2) a host cell comprising the vector; (3) a plasmid comprising the nucleic acid; (4) a transformed cell comprising the nucleic acid; (5) a vaccine against E tenella, E. acervulina, c. the nucleic acid; (7) a vaccine against E. tenella, E. acervulina, c. E. necatrix, E. pracox, E. maxima, E. mitis or E. brunetti or a neurosorganism expressing an immunologically cross-reactive antigen; (8) immunising a subject against infection by Eimeria, or a microorganism expressing an immunologically cross-reactive antigen; (9) conferring upon a newborn subject of an avian species maternal immunity against infection by Eimeria; (10) a fertilised egg from an avian species having an air sac, is inoculated with the vaccine; and (11) reducing the output of Eimeria acis inoculated with the vaccine; and (11) reducing a vaccine and in gene therapy. The nucleic acid is useful for preparing a vaccine against E. tenella, E. acervulina, E. necatrix, E. praceox, E. maxima, E. mitis or E. brunetti infection. The present sequence, which is represents a 250 kDa antigen protein homologous DNA sequence, which is

No. is the number of results predicted by chance to have a score greater than or equal to the score of the result being printed, and is derived by analysis of the total score distribution.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        Description

Neuherberg, GERMANY

Clone from S. Wiemann, Molecular Genome Analysis, German Cancer Research Center (DKFZ); Email s wiemann@dkfz-heidelberg.de;

Requenced by DKEZ (German Cancer Research Center, Heidelberg/Germany) within the cDNA sequencing consortium of the German Genome Project. This clone (DKFZp686B17277) is available at the RZPD Deutsches Ressourcenzentrum fler Genomforschung GmbH in Berlin, Germany. Please contact RZPD for ordering:

Berlin, Germany. Please contact RZPD for ordering:

Genome. 12, 673-677 (2001)

Normalization and subtraction of cap-trapper-selected CDNAs to prepare full-length CDNA libraries for rapid discovery of new genes. Genome Res. 10 (10), 1617-1630 (2000)

RIKEN integrated sequence analysis (RISA) system--184-format sequencing pipeline with 384 multicapillary sequencer. Genome Res. 10 (11), 1757-1771 (2000)

Computer-based methods for the mouse full-length CDNA encyclopedia: real-time sequence clustering for construction of a nonredundant cDNA library. Genome Res. 11 (2), 281-289 (2011)

CDNA library was prepared and sequenced in Mouse Genome Broyclopedia Project of Genome Exploration Research Group in Riken Genomic Sciences Center and Genome Science Laboratory in Riken Division of Experimental Animal Research in Riken contributed to
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            Email: genome-res@gec.riken.jp, URL:http://genome.gec.riken.jp/

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 Pred. No. is the number of results predicted by chance to have a score greater than or equal to the score of the result being printed, and is derived by analysis of the total score distribution.
                                                                                                                                                                                                                                                           1134
